Case 40 (anemia)

Mrs. Huda, a 25-year-old lady in her fourth pregnancy, is seen in the antenatal clinic at 20 weeks' gestation. She has history of poor diet intake and poverty with short intervals between successive pregnancies. Her blood investigations are: Hb% = 6.9 g/dl and all red blood cell indices (MCV, MCH and MCHC) are markedly reduced.

40.1 What is the most likely diagnosis? How would you confirm your diagnosis?

.....
.....
.....
.....
.....

40.2 Counsel her regarding fetal and maternal outcome.

.....
.....
.....
.....
.....
.....

40.3 Discuss your plan of management.

.....
.....

.....
.....
.....
.....
.....

40.4 How may the risk of blood transfusion be reduced in obstetric population?

.....
.....
.....
.....
.....
.....

40.5 Outline four risks of blood transfusion?

.....
.....
.....
.....
.....
.....
.....
.....

40.6 Discuss four blood components that may be required in the treatment of massive obstetric hemorrhage and describe in what clinical situation they may be used?

.....
.....
.....
