

5th year women care block

Dear Student:

Year 5 of phase 2 MBCHB program of College of Medicine at University of Sulaimani comprises 5 clinical blocks: Special Surgeries; Nervous System and Cancer Cares; Mental Care; Child Care and Womn Care.

The grading distributions among all five blocks are equal. I.e. all blocks have the same grading power and credit:

Women Care 20%

There are two main kinds of assessment thru out the year: Formative and Summative Assessments. Formative assessments are distributed thru out the blocks and aimed at improving your performance. i.e. formative assessments do not determine whether you succeed to next year or not. Instead it is the summative assessments which determine your path.

In order to understand how you can proceed to next academic year, you need to get through both Workload and End Year-5 Assessment (EYA-5):

Workload:

Is the total grade that you will collect throughout the entire academic year over the five clinical blocks mentioned above. Workloads accounts for 40% of the entire assessment. Each block has a share of 8%. Out of this eight percent, you are in charge to collect 3% from your daily activities in terms of participation, seminars, case presentations, etc... Additional 5% is allocated to End Block Assessment (EBA).

End Year-5 Assessment (EYA-5):

The final summative examination at the end of the academic year consists of two parts: paper one (100 single best answer questions) and paper two (100 case scenario integrated questions in single best answer format).

Both papers account 60% of your total grade.

In order to proceed to next year, you are in need to achieve a total score of at least 50% which is (summation of the final summative examination and year workload scores).

If a student cannot collect a total of 50%, the student has to sit the Trial 2 End Year-5 Assessment in the summer. If a student cannot collect 50% by the Trial 2, then the student has to repeat the entire academic year.

Women care

1- Maternal medicine

15%

Hypertensive disorder in pregnancy + diabetes in pregnancy

Kidney disease and UTI in pregnancy

Heart disease in pregnancy

GIT problem in pregnancy and medical disease of pregnancy

Bleeding disorder in pregnancy

Coagulation disorder in pregnancy.

Antiphospholipid syndrome.

Anemia in pregnancy

2- Fetal medicine

8%

Rh isoimmunization

Congenital and chromosomal
abnormalities
